

OXYGEN/OZONE THERAPY INFORMED CONSENT

I, _____, do voluntarily, knowingly, and willingly give my consent to the administration of dental oxygen/ozone treatments. I seek this treatment at my own request.

I understand that dental oxygen/ozone therapy involves the injection of a mixture of oxygen and ozone in the form of a gas with or without local anesthetic, into the skin, mucous membranes, muscles, joints, jawbones, and teeth of the head, neck and associated structures. Dental oxygen/ozone therapy is defined as the creation of a therapeutic oxygen rich environment, which induces a multi-factorial positive biochemical and physiologic change in the affected tissues. Dental oxygen/ozone therapy has the following dental relevant and useful properties: it kills bacteria, viruses, fungi and parasites. It is a circulatory stimulant, a wound-cleanser, an accelerant for wound healing, a hemostatic agent, and an immune activating agent. There may be other effects that at this time are unknown.

I understand that I should tell the doctor or staff if I have ever had an allergic reaction to any anesthetic, particularly dental anesthetics prior to any treatment involving injections with anesthetics.

There are potential side effects with all types of dental treatments. Dental oxygen/ozone therapy carries with it some risk of side effects, such as: pain and/or discomfort at the injection site, soreness and temporary bruising. There may be a red, inflamed, blister-type area at the injection site. This area usually heals in a 1-5 day time period. All types of medications have some risk of allergic reactions. An allergic reaction to the mixture of oxygen/ozone would be unusual, and usually restricted to the injection site. The most common patient comment is that there is a warm to burning sensation at the site of the injection. Some patients may experience flu-like symptoms for 2 to 3 days following treatment.
